

Your waste is our responsibility

# Waste Management

**Experience excellence in waste management with our industry-tailored solutions. We offer you a complete package of services ranging from efficient operation of waste management centres and expert consulting to safe disposal. Our team ensures seamless waste collection, segregation, and logistics, all handled digitally for transparency and efficiency, maintaining the highest standards. Let us help you implement environmentally responsible and legally compliant waste management solutions in your factory today.**

## **Waste management operation**

At Leadec, we ensure efficient operation of your waste management centres. Our team guarantees that all the non-hazardous and hazardous waste from the facility locations is collected, disassembled, sorted, and segregated according to the applicable laws and regulations. We make sure that the waste is compressed, precisely weighed, stored, packaged, and assigned to the transport containers at the available disposal points. We guarantee compliance with the highest safety and environmental standards through our rigorous departure control procedures. We manage the disposition of the waste, which includes preparation of necessary freight and disposal documents, organisation of cost-effective transport, and scheduling of disposal measures with contractual partners. All waste management processes are operated and recorded digitally, ensuring minimum human intervention and transparent operation.

## **In-house logistics**

Our in-house waste logistics solution ensures regular waste collection and meticulous

segregation into colour-coded bins, guaranteeing precise handling of diverse waste types. With our forklifts, we take care of heavy-duty operations such as emptying containers, unloading trucks, and transporting heavy waste in the factory. We offer you a complete package by maintaining and cleaning all waste containers and keeping them ready for operation.

## Leadec's approach to performance improvement

With our holistic optimisation approach to streamlining your waste management system, we ensure that we cover all short and long-term improvement dimensions. We usually start with quick-win solutions such as lean principles or assessing waste streams. We further train and educate your staff, e.g., using visual instruments to ease operation and better manage supply chains. Once the waste streams are fully mapped, inefficiencies can be identified and tackled, and the improvement measures can be monitored via KPIs and

regular waste reviews. We evaluate sophisticated approaches such as circular economy or zero waste principles with your operation staff and jointly implement them if feasible. Furthermore, the implemented measures are continuously tracked and reviewed with respect to performance. In this way, a structured continuous improvement process is established to enhance the overall waste management performance.

Assess current waste practices "establish performance baseline"	Implement lean tools (5S, operation flows, 8 waste principles)	Start continuous improvement projects	Map waste streams and identify inefficiencies	Enhance supply chain partner training, education, and engagement	Introduce KPIs, SMART goals, regular reviews for waste	Review waste practices and hierarchy	Strategies for circular economy and zero waste services
